CAFÉ STATION · COFFEE ROCK

Café Station TDS chart.

Coffee Rock adds a set amount of minerals on top of the purified water. Expected TDS is your purified (RO) reading plus the value for your dosing level.

Coffee Rock dosing (mL/L)	1.5	2.0	2.5	3.0	3.5	4.0	4.5
Added by Coffee Rock (ppm)	+45	+65	+85	+98	+110	+123	+135
Expected TDS (ppm) with RO water at 6 ppm	51	71	91	104	116	129	141
Acceptance ±10 ppm	41–61	61–81	81–101	94–114	106–126	119–139	131–151

MEASURE TDS IN FIVE STEPS

1. **Use a reliable meter**
   Set it to the 0.7 conversion factor. If it only reads 0.5, multiply the reading by 1.4.
2. **Sample the right point**
   Use the Bluewater faucet. If that is not possible, sample directly from the pressureless tank.
3. **Never the espresso machine**
   Machine piping and heated tanks change the reading.
4. **Flush, then pour 1 litre**
   Flush 1 litre and discard it, then pour 1 litre so the dosing is active and stable.
5. **Measure cold water**
   Dip the meter, wait a few seconds and read. Change the setting if wanted and repeat.

Values from the Bluewater Coffee Rock TDS chart (Aug 2026), reference meter Hanna HI98192 at 0.7 conversion factor. If your RO water reads differently from 6 ppm, add your own RO reading to the "Added by Coffee Rock" row.

CAFÉ STATION · COFFEE ROCK

Measure the purified water first.

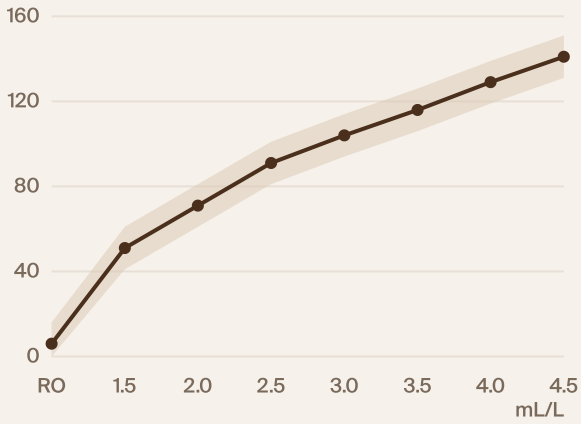

TDS (Total Dissolved Solids) tells you how much is dissolved in the water. Meters on the market vary a lot in accuracy, and cheaper meters often are not sensitive enough to detect all dissolved minerals, so they read low.

TDS adds up. Whatever the purifier lets through is added to what Coffee Rock doses. If TDS after mineralisation looks wrong, measure the purified water before mineralisation as well. Above 10 ppm points to worn membrane or pre-filters.

To help with a TDS claim we prefer measurements from a high-quality meter, taken as described on page 1. If you only have your current meter, send us two readings: **the RO water (no minerals)** and **the 4.5 mL/L setting**. We will send back a theoretical chart for your meter.

Purified (RO) water	**below 10 ppm**
Meter conversion factor	**0.7 (0.5 × 1.4)**
Acceptance at any dosing level	**±10 ppm**

EXPECTED TDS, COFFEE ROCK

Line: expected TDS with RO at 6 ppm. Band: ±10 ppm acceptance.

> **The read: check the RO water and the meter's conversion factor before changing the dosing.** Both change the reading without anything being wrong with the dosing.

Contact your local Bluewater support team with both readings and a screenshot of the About page in the Bluewater Serve app.
